

# Changes in Heavy Rainfall Intensity

**TODAY (1990-2019 AVERAGE):** A heavy rainfall event (1% rainfall event) occurs when rainfall exceeds 1.9 inches in 24 hours, which happens 1.6 days per year.

# Changes in Heavy Rainfall Intensity

**TODAY (1990-2019 AVERAGE):** A heavy rainfall event (1% rainfall event) occurs when rainfall exceeds 1.9 inches in 24 hours, which happens 1.6 days per year.

## BY 2050-2079 TIME PERIOD:

**High emissions scenario:** Compared to today, the heavy rainfall event will very likely intensify (90% chance), based on 100% of the range in model results. The average will increase by 8% to 2 inches.

**Low emissions scenario:** Compared to today, the heavy rainfall event will likely intensify (85% chance), based on 100% of the range in model results. The average will increase by 5% to 2 inches.

# Changes in Heavy Rainfall Frequency

**TODAY (1990-2019 AVERAGE):** A heavy rainfall event (1% rainfall event) occurs when rainfall exceeds 1.9 inches in 24 hours, which happens 1.6 days per year.

# Changes in Heavy Rainfall Frequency

**TODAY (1990-2019 AVERAGE):** A heavy rainfall event (1% rainfall event) occurs when rainfall exceeds 1.9 inches in 24 hours, which happens 1.6 days per year.

## BY 2050-2079 TIME PERIOD:

**High emissions scenario:** Compared to today, the number of days with a heavy rainfall event will likely increase (68% chance), based on 100% of the range in model results. The average will increase by 48% to 2.3 days per year.

**Low emissions scenario:** Compared to today, the number of days with a heavy rainfall event is about as likely as not to increase (60% chance), based on 100% of the range in model results. The average will increase by 33% to 2.1 days per year.
